Amendment to the Claims:

This listing of claims 1-14 will replace all prior versions, and listing of claims in the application. Claims 1-11 and 13 have been amended, Claim 12 has been cancelled, and claim 14 has been added.

1. (Currently Amended) A fixation member, comprised of elastic material, for mounting an object to a frame, the fixation member comprising ~~consisting of~~:

~~elastic material, comprising~~

a first portion and a second portion interconnected by first spring means, said first portion having first catch means and second catch means for respectively engaging said fixation member with said frame and disengaging said fixation member from said frame,

said first catch means causing engagement of said fixation member to said frame upon ~~for engaging with a frame to which the fixation member is to be fixed after~~ said first portion being ~~is~~ pushed towards said second portion, thereby tensioning ~~while~~ said first spring means to push said second portion against said frame to subsequently engage said first catch means with said frame, and ~~said first portion furthermore having~~

said second catch means causing disengagement of said fixation member from said frame upon ~~for engaging with corresponding catch means of said second portion when~~ said first portion ~~is~~ being pushed further towards said second portion against an increasing tensioning force of said first spring means, whereby said second catch means engages with corresponding catch means of said second portion and said first catch

means retracts to subsequently disengage said fixation member from said frame ~~and thereby disengages from the engagement with said frame~~.

2. (Currently Amended) A fixation member as claimed in claim 1, wherein ~~characterized in that~~ the fixation member is made of one piece of elastic material.

3. (Currently Amended) A fixation member as claimed in claim 1, wherein ~~characterized in that~~ the fixation member is made of plastic material comprising elastic metal parts.

4. (Currently Amended) A fixation member as claimed in claim 1, wherein ~~characterized in that~~ said second portion is provided with second spring means for abutting against said frame thereby pushing said second portion in a direction away from said frame.

5. (Currently Amended) A fixation member as claimed in claim 1, wherein ~~characterized in that~~ said first portion is provided with a substantial flat button surface substantial perpendicular with respect to the direction in which said first portion can move relative to said second portion, which button surface can be touched by a finger.

6. (Currently Amended) A fixation member as claimed in claim 1, wherein ~~characterized in that~~ said elastic material substantially extends between two parallel planes, whereby a substantial part of the surface of the fixation member substantially coincides with said

planes.

7. (Currently Amended) A fixation member as claimed in ~~any one of~~ claim 1, characterized in that said first spring means comprise at least two spring elements, whereby one end portion of each spring element is elastically connected to said first portion and the other end portion is elastically connected to said second portion of the fixation member.

8. (Currently Amended) A fixation member as claimed in claim 7, wherein ~~characterized in that~~ each spring element comprises a slender part between said two end portions to facilitate the elastic movement of said end portions relative to each other.

9. (Currently Amended) A fixation member as claimed in claim 1, wherein ~~characterized in that~~ said first catch means comprise at least one elastically hinging catch element extending outwardly from said first portion, and in that said second portion of the fixation member comprises a guiding surface for contacting said catch element and for pushing it inwardly when the two said portions are pushed further towards each other into the position whereby the second catch means engage.

10. (Currently Amended) A fixation member as claimed in claim 1, wherein ~~characterized in that~~ said second catch means comprise an elastically hinging catch

element connected to one of said portions, and in that said corresponding catch means comprise a substantially fixed catch element connected to the other portion of the fixation member.

11. (Currently Amended) A fixation member as claimed in claim 10, wherein ~~characterized in that~~ the said hinging catch element is provided with a protrusion to be touched by hand, to disengage the second catch means.

12. (Cancelled)

13. (Currently Amended) A method for fixing an object being attached to a fixation member to a frame, the fixation member comprising ~~consisting of~~ elastic material and comprising a first portion and a second portion interconnected by first spring means, whereby said first portion is connected to the frame by first catch means after said first portion is pushed towards said second portion, while said first spring means push said second portion against said frame, and whereby the object is released from the frame by further pushing said first portion towards said second portion against an increasing force of said first spring means, whereby second catch means of said first portion engage with corresponding catch means of said second portion, and whereby said first catch means retract and thereby disengage from the engagement with said frame.

14. (New) An automotive lamp provided with a fixation member, the fixation member being comprised of elastic material, for mounting an object to a frame, the fixation member comprising:

a first portion and a second portion interconnected by first spring means, said first portion having first catch means and second catch means for respectively engaging said fixation member with said frame and disengaging said fixation member from said frame,

said first catch means causing engagement of said fixation member to said frame upon said first portion being pushed towards said second portion, thereby tensioning said first spring means to push said second portion against said frame to subsequently engage said first catch means with said frame, and

said second catch means causing disengagement of said fixation member from said frame upon said first portion being pushed further towards said second portion against an increasing tensioning force of said first spring means, whereby said second catch means engages with corresponding catch means of said second portion and said first catch means retracts to subsequently disengage said fixation member from said frame.
